5a) Initial situation

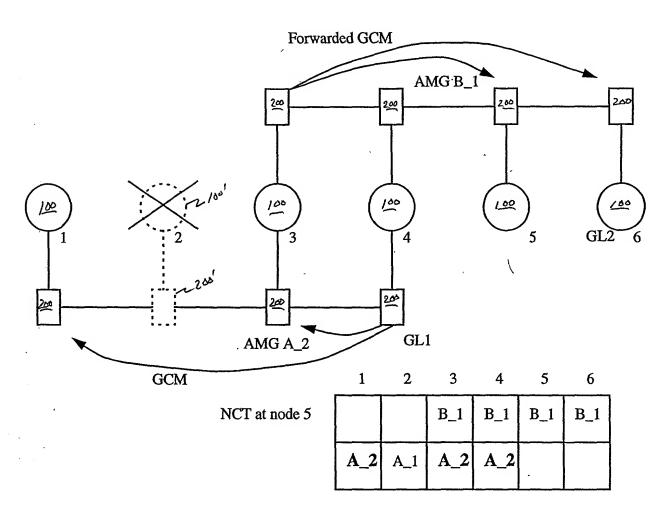

Figure 5: Topology Propagation Scenario: node death

#### 11/30 P04920020018USI

5b) Node 2 dies: Nodes 1, 3, and 4 form AMG A\_2

#### 12/30 Pou920020018USI

5c) GCM for AMG A\_2 is propagated to all nodes

#### 13/30 Pou920020018 USI

Network A: 10 seconds detection time Network B: 40 seconds detection time

Nodes 1 and 2 are forming AMGs on networks A and B

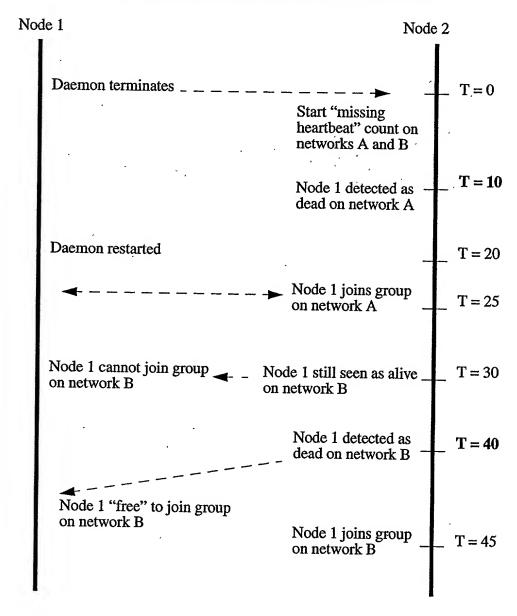

Figure 7) Inconsistency caused by quick daemon restart in the presence of different detection times for each network: the daemon on node 1 goes down and is restarted, but this is never detected by node 2.

#### 14/30 Poug 20020018 USI

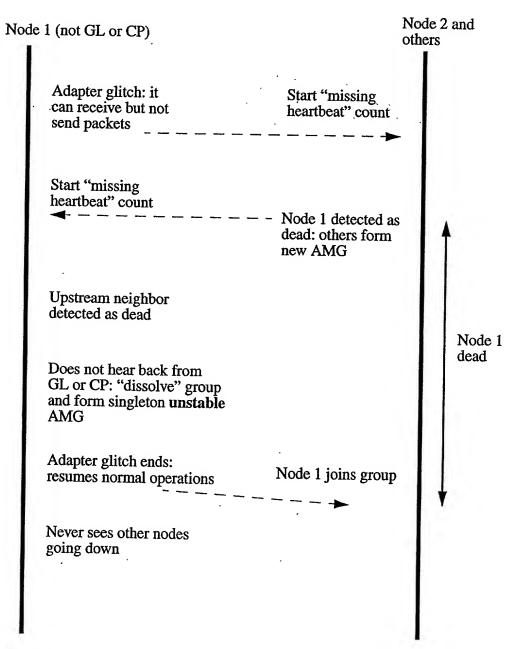

Figure (3) Inconsistency caused by temporary communication problem in an adapter: node 1 is not the GL or CP in its group. Node 1 never notices other nodes as down, though the others do see node 1 being unreachable.

#### 15/30 Pou920020018 USI

Node	e 1 (GL or CP)		ode 2 and ners
	Adapter glitch: it can receive but not send packets	Start "missing heartbeat" count	
	Start "missing heartbeat" count  Upstream neighbor detected as dead	— — Node 1 detected as dead: others form new AMG	<b>A</b>
	Adapter glitch ends: resumes normal operations  Sends PTC to all peers except upstream neighbor		Node 1 dead
		Replis with PTC ACK	
	Sends COMMIT to all peers	Node 1 joins group	
	Never sees other nodes going down		
1			

Figure (\*) Inconsistency caused by temporary communication problem in an adapter: node 1 is the GL or CP in its group. Node 1 never sees the other nodes as unreachable, while the others do see node 1 as unreachable for a period.
